1. Introduction

According to the National Cancer Institute, North American Association of Central Cancer Registries, and National Centre for Health Statistics, cancer is the leading cause of death throughout the world [1]. Cell division, growth, and differentiation get out of control in malignancy, resulting in the development of mass of cells called tumor, except in some types of leukemia. Sometime cancerous cells disseminate from the neoplasm and spread in blood stream, thereby, leading to the formation of secondary tumors, known as metastasis. Numerous FDA approved therapeutic antibodies are available on the market for addressing diverse types of malignancies.

2. Types of malignancies

2.1. Gastric cancer
2.2. Prostate cancer
2.3. Breast cancer
2.4. Nasopharyngeal carcinoma
2.5. Ovarian cancer
2.6. Bone cancer
2.7. Colorectal carcinoma
2.8. Hepatocellular carcinoma

3. Discussion

Conflict of interest
